

Front-End Developer

Company Profile

Simgo's cloud based virtual SIM management platform removes the physical SIM card from mobile devices and places it in the cloud. The platform is then able to dynamically assign any SIM card to the mobile device based on criteria such as time, location and coverage, cost and other preferences. Simgo's platform minimizes the cost and effort of managing connectivity as well deployment and security for large fleets of connected devices.

The virtual SIM management platform manages all vSIM enabled connected devices. Simgo's platform is available as an SDK to be easily integrated directly into any connected IoT device's chipset as well as directly into the Smartphone at the manufacturing stage, thereby creating a software only solution, without additional hardware requirements. Additionally, Simgo offers after-markets solutions such as our vSIM portable Hotspot and vSIM cover, that brings the virtual SIM capability to the iPhone.

What You Will Do

Front End Developer:

A great product has almost zero chances of succeeding without a great interface and a wonderful user experience. Our front end developer will be in charge of ringing all the bells and blowing all the whistles needed to make us heard and stand out from the competition. Our ideal candidate lives for designing and has a great passion for developing outstanding tools for diverse systems.

What You Are Good At:

Must have:

- HTML
- CSS
- Bootstrap
- JavaScript
- JQuery
- Basic SQL concepts (MySQL)
- Object Oriented concepts
- Web design general concepts
- Experience in creating responsive web sites

Good to have:

- NodeJS
- React
- Java
- Python
